真空陶瓷压滤机

VACUUM CERAMIC FILTER PRESS

产品简介 PRODUCT INTRODUCTION

陶瓷过滤机是当今世界先进的固液分离设备，其核心部件陶瓷过滤板由芬兰奥托昆普公司研制成功，陶瓷过滤板孔径通常为1—5微米（最常用的为1.5—2.0微米），这样的微孔能产生强烈的毛细作用，盘式过滤机工作时，在真空泵的作用下，只有液体通过微孔成为滤液，而固体和气体被阻隔在滤板表面成为滤饼，实现了固液分离。

陶瓷过滤机可广泛用于砂石骨料、煤炭、石材、陶瓷、有色金属矿山等行业的脱水处理，应用领域广泛。

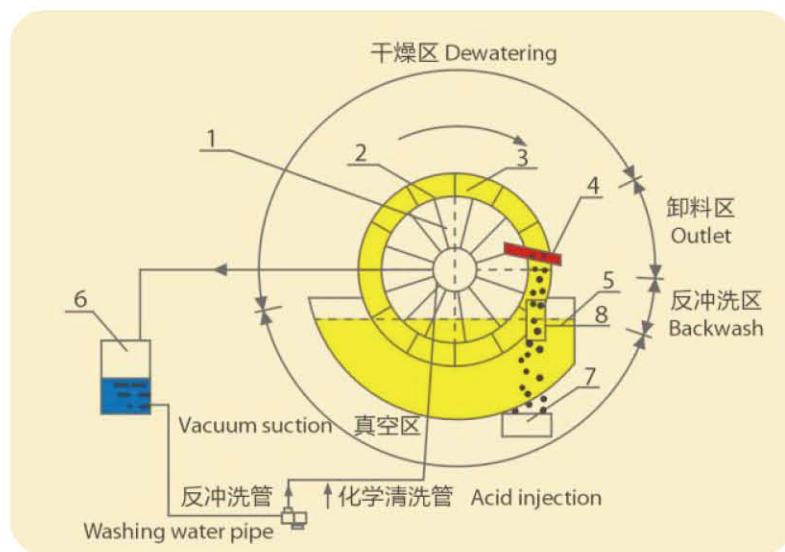

Ceramic filter is an advanced solid-liquid separation equipment in the world. Its core component, ceramic filter plate, was successfully developed by Otto Kunpu Company of Finland. The aperture of ceramic filter plate is usually 1-5 microns (the most commonly used is 1.5-2.0 microns). Such micropores can produce strong capillary action. When disc filter works, only liquid becomes filtrate through micropores under the action of vacuum pump, while solid and gas are blocked on the surface of filter plate to become filter cake, thus realizing solid-liquid separation.

The ceramic filter can be widely used for dewatering sand and gravel aggregates, coal, stone, ceramics, non-ferrous metal mines and other industries, and has a wide range of applications.

带式压滤机
BELT FILTER PRESS

产品简介 PRODUCT INTRODUCTION

带式压滤机是通过机器上网带之间的物理挤压对泥浆进行脱水的环保设备，污泥首先与絮凝剂进行混合反应并絮凝成团，然后经过预脱水区→浓缩脱水区→低压排水区→S型挤压区→高压区，使污泥水份逐步通过网带之间的挤压力透过网带排出，最后形成泥饼排出。

Belt filter press is an environmental protection device that dewateres mud through physical extrusion between belt belts on the machine. Sludge is mixed with flocculant to react and flocculate into lumps, and then passes through pre-dewatering area → concentration dewatering area → low pressure drainage area → S-shaped extrusion area → high pressure area so that sludge moisture is gradually discharged through the belt through the extrusion force between belt belts and finally discharged into mud cake.

脉冲袋式除尘器

PULSE BAG FILTER

产品简介 PRODUCT INTRODUCTION

袋式除尘器是指采用纤维性滤袋搜集粉尘的除尘设备。该设备有在线清灰（YDMC型）和离线清灰方式（YDLC型）供用户选择。在线清灰方式的除尘器综合了分室反吹和脉冲喷吹各类除尘器的优点，使过滤与脉冲清灰分开进行，提高了除尘的效果。离线清灰方式的除尘器有清灰彻底，滤袋使用寿命长，对压缩空气的压力要求低等优点。

Bag filter refers to the dust removal equipment that uses fibrous filter bags to collect dust. The equipment has online cleaning (YDMC type) and offline cleaning methods (YDLC type) for users to choose. The dust collector of the online cleaning method combines the advantages of various types of dust collectors with sub-chamber backflushing and pulse injection, so that filtration and pulse cleaning are carried out separately, which improves the effect of dust removal. The off-line dust collector has the advantages of thorough dust removal, long service life of the filter bag, and low pressure requirements for compressed air.

突出优点 HIGHLIGHT THE ADVANTAGES

除尘效率高，除尘效率通常 $> 99\%$ 。

High dust removal efficiency, dust removal efficiency is usually $> 99\%$.

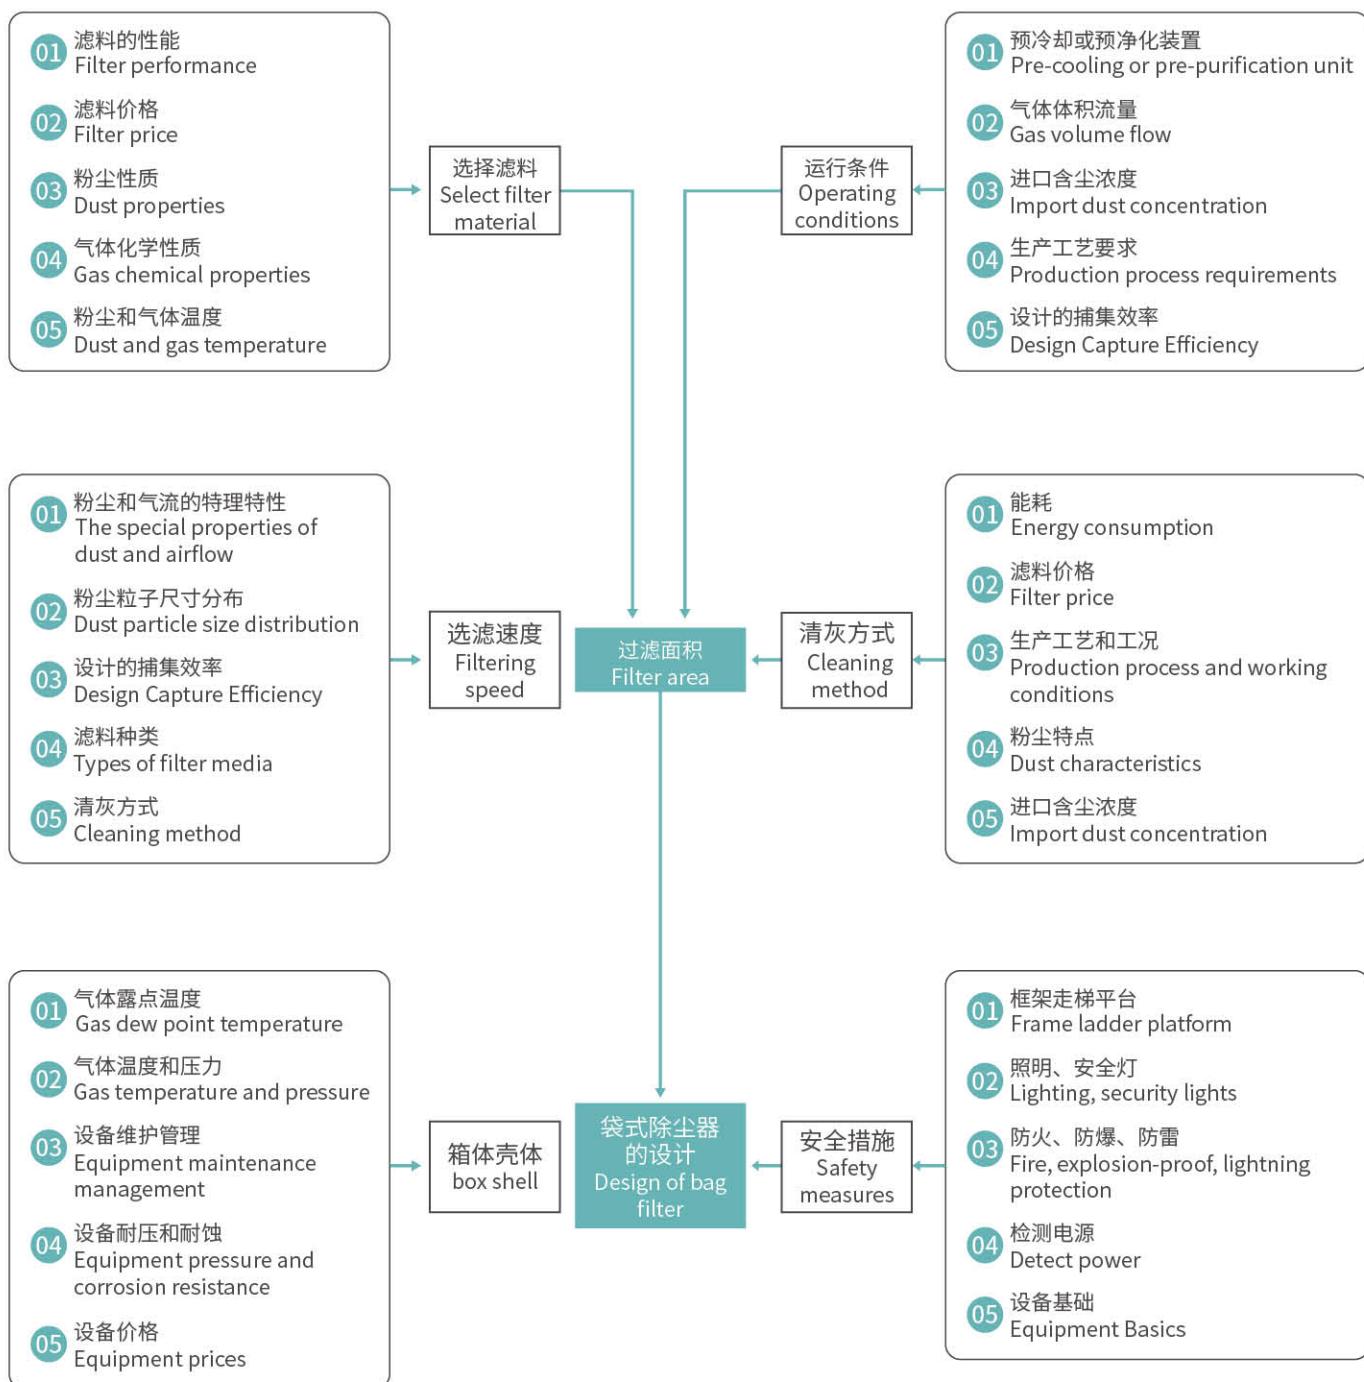

运行稳定，不受风量波动影响。

设计特点 DESIGN FEATURES

YDLC 型脉冲袋式除尘器设计特点是在滤袋口上不设文氏管，也没有喷吹管，而是用脉冲阀直接往净气室喷压缩空气进而向滤袋清灰。这样既降低喷吹工作阻力，又便于逐室进行检测，换袋。电磁脉冲阀数量为每室 1-2 个，规格为 2-3in (1in=2.54cm)。

The design feature of YDLC type pulse bag filter is that there is no venturi on the mouth of the filter bag, and there is no spray pipe, but the pulse valve is used to directly spray compressed air into the clean air chamber to clean the filter bag. This not only reduces the working resistance of blowing, but also facilitates the detection and bag replacement chamber by chamber. The number of electromagnetic pulse valves is 1-2 per chamber, and the specification is 2-3in (1in=2.54cm).

YDLC 型脉冲袋式除尘器集分室反吹和脉冲喷吹等除尘器的特点，增强了使用适用性。可作为破碎机，烘干机，煤磨，生料磨，篦次冷机，水泥磨，包装机及各库顶收尘设备，也可作为其他行业设备。

YDLC type pulse bag filter has the characteristics of dust collectors such as sub-chamber backflushing and pulse injection, which enhances the applicability of use. It can be used as crusher, dryer, coal mill, raw meal mill, grate sub-cooler, cement mill, packaging machine and dust collection equipment on the top of each warehouse, as well as other industrial equipment.

除尘器滤袋

DUST COLLECTOR FILTER BAG

滤袋是袋式除尘器的心脏，通常圆筒型的脉冲式滤袋垂直悬挂在除尘器中。

含尘气体由进风口进入除尘器，经过灰斗的导流板，使气体中的部分大颗粒粉尘受惯性力的作用被分离出来，直接落入灰斗。含尘气体进入箱体的滤袋过滤区，绝大多数粉尘被捕集在滤袋的外表面上，气体通过滤料进入滤袋内部，净化后的气体经出风口排出。滤袋内部的笼架用来支撑滤袋，防止滤袋塌陷，同时它有助于尘饼的清除和重新分布。

The dust collector bag is the core element of the cylindrical impulse type dust collector bag is suspended in the dust collectors vertically. Dust gas enters the dust hopper directly by inertia. When dust gas enters the dust collector bag from the air inlet and the passage board, making most big dust particle filtered out into the dust hopper directly by inertia. When dust gas reaches the filtering area of the box with dust collector bags, most dust is captured on the outer surface of the dust collector bags, and the gas flows into the pocket through filter. Media then purified gas discharges from the outlet. The cage inside the pocket is used to support and prevent the pocket to collapse while it is helpful to remove and redistribute the dust cake.
